Usability Report — EMS Scenario D (Support requests) — Lê Phạm Kiều Duyên, 23127184

> **Status: NOT YET RUN. 0 of 5 participants recruited, 0 sessions held.** Every table below is an empty template. No number, quote, timing, participant or SUS answer in this file may be written from anything except a real session actually held with a real person — §12 of the brief makes a fabricated participant grounds for **0 on Task 2**, and the TA may telephone up to 2 of the 5 to verify them. An AI can design, score, cluster and draft this study; it cannot be a participant, recruit one, or supply one session's data.
>
> Fill each section only from `docs/usability_testing/session_notes/Session_P1..P5.md`, scored via `docs/usability_testing/SUS_Responses.csv` and tabulated in `docs/usability_testing/Metrics_Table.md`. If a section is still empty at submission time, leave it empty and say so — an honest gap costs less than an invented fact.

Section map against the brief. §6 Task 2 Phase 3 requires the report to contain: the scenario (§3 below) · the participant table, 5 people, masked (§5) · the metrics tables (§6 task metrics, §7 SUS) · the findings ranked by severity **with a screenshot each** (§9) · a prioritised list of concrete recommendations (§11). §7 of the brief requires genuine bugs to be logged through the findings channel (§13 below). Nothing here may be deleted as "not applicable"; each one is separately marked in the rubric.

---

1. Method and what was measured

Method	Moderated think-aloud, one participant at a time
Participants	**n = 5** counted, all outside this class, **+ 1 pilot** (not counted)
Session length	~20–25 minutes per participant
Session language	Vietnamese (all participant-facing wording; this report is in English)
Mode / device	TBD — in person or remote screen-share; participant's or moderator's machine
Dates	TBD
Instrument	**SUS**, 10 items, administered after both tasks and **before** the probe questions
Recording	Screen recording, plus audio where the participant consented; consent captured before recording started
Moderator	Lê Phạm Kiều Duyên

Measures collected, the minimum set named in §6 Task 2 Phase 1:

Measure	Definition used	Where it lands
Task success	Complete / Partial / Fail against criteria fixed **before** the sessions (§3)	§6
Time on task	From the participant beginning to act on the prompt until the success criterion; intervened runs excluded from means	§6
Errors	Wrong actions requiring recovery	§6

Measure	Definition used	Where it lands
Hesitations	Pauses of roughly 3 s or more, backtracking, re-reading	§6
SUS	10 items, 1–5, reverse-scored at positions 2/4/6/8/10 by `score_sus.py`	§7
Open probes	Four fixed questions: clarity · error recovery · speed · trust	§8

2. Screens under test

Page the participant reaches	Route	Package screen	Reached in
Create Support Request form	`/complaints/new`	**D1**	Task 1
My Requests list	`/complaints`	**D2** (list)	Task 2
Request detail with the official response	`/complaints/{id}`	**D2** (detail)	Task 2
Notifications bell / list / detail	`/notifications`, `/notifications/{id}`	**D5**	Only where a participant went there unprompted — record which did

Three distinct user-facing pages across the same package screens tested in Task 1B (`docs/02_Task1B_Execution_Report_ScenarioD.md`), plus a fourth reached only by participants who chose that route. **D3** and **D4** (admin list and admin detail) are operated by the moderator to resolve each request mid-session and are never shown to a participant — exercised, not user-tested. See §12 (Limitations).

3. Task scenario

Full design, success criteria and moderator script: `docs/usability_testing/Task_Scenario_D.md`. Goal-oriented, no click path given, and deliberately avoiding EMS's own vocabulary so the task tests findability rather than reading comprehension.

Task 1 (verbatim, as spoken):

> "*Bạn hãy tưởng tượng là bạn đã đăng ký tham gia một sự kiện trên trang web này, nhưng tới hôm diễn ra sự kiện, lúc bạn check-in thì hệ thống lại báo là bạn chưa hề đăng ký. Bạn muốn chuyện này được xử lý. Bạn hãy dùng trang web để báo lại vấn đề đó, theo cách nào bạn thấy là đúng — các thông tin chi tiết (tên sự kiện, ngày bạn đăng ký, v.v.) thì bạn cứ tự nghĩ ra thoải mái nhé.*"

English gloss: "*Imagine you registered for an event here, but on the day the check-in said you were never registered. You want it fixed. Use the platform to report the problem, however you think is right — invent whatever details you need.*"

Success: a support request submitted with a request type, a description, and at least one image attached. *Partial:* submitted but missing the image, or with an unclear description. *Fail:* could not submit, or gave up.

Task 2 (verbatim, handed over after the moderator has quietly resolved the request):

> "*Cái vụ lúc nãy bạn báo đó, giờ bạn thử xem có ai trả lời lại chưa, rồi đọc cho mình nghe họ nói gì nhé.*"

English gloss: "*That thing you reported earlier — check whether anyone has replied, and read me what they said.*"

Success: the participant finds their own request without being told the menu name and reads the official response back correctly. *Partial:* finds the request but misses or misreads the response. *Fail:* cannot find where the request went.

4. Pilot

Required by §6 Task 2 Phase 1: one extra person, run before the counted sessions, to catch unclear wording or a broken flow. **Pilot data never enters §6, §7 or §8.**

Pilot run on	TBD
Problems the pilot exposed	TBD
Changes made to the script/setup before P1	TBD — or state explicitly "none needed" if that is what happened

5. Participants

Five real people, all outside this class, contacts masked per §12 (middle four digits). The unmasked list is held privately by the moderator and is **not** in this repository or the submission zip. Source of record: `docs/usability_testing/Participants_Table.md` — keep the two copies identical.

P	Name (or initials)	Profile	Outside this class	Contact (masked)	Session date	Consent: screen / audio
P1	TBD	TBD	TBD	TBD	TBD	TBD / TBD
P2	TBD	TBD	TBD	TBD	TBD	TBD / TBD
P3	TBD	TBD	TBD	TBD	TBD	TBD / TBD
P4	TBD	TBD	TBD	TBD	TBD	TBD / TBD
P5	TBD	TBD	TBD	TBD	TBD	TBD / TBD

Recruiting channel and screener: `docs/usability_testing/Recruiting_Kit.md` §1–§4. Masking format: `0901234567` → `090****567`, exactly four digits hidden.

6. Metrics — task success, time, errors

Copied from `docs/usability_testing/Metrics_Table.md` once the five sessions are tabulated. Reported as counts out of 5, not percentages.

Task	Success rate (Complete, of 5)	Partial	Fail	Mean time (clean Completes only)	Time range	Total errors	Total hesitations
T1 — file the report	_/5	_/5	_/5		–		
T2 — find the response	_/5	_/5	_/5		–		

Runs excluded from either mean, and why: TBD.

Per-participant breakdown (the table above is derived from this one, in `docs/usability_testing/Metrics_Table.md` §"Per-participant results"): TBD.

7. Metrics — SUS

Scored with `python .claude/skills/usability-test-study/scripts/score_sus.py docs/usability_testing/SUS_Responses.csv --instrument sus --markdown`. Report all five individual scores, the mean **and** the range — a mean alone cannot distinguish five participants who agreed from five who were split.

Participant	SUS score	Adjective
P1		
P2		
P3		
P4		
P5		
Mean		

n = 5, SD = , range – . Descriptive only: no confidence interval, no significance claim, no "above/below the industry average" stated as a measurement.

8. Probe question responses

Asked after the SUS, same wording every session (Vietnamese wording in `docs/usability_testing/SUS_Instrument_VI_EN.md` §4). Summarise across the five participants and quote verbatim where a quote carries the point; attribute each quote to P1–P5 and to a timestamp in that session's notes.

Probe	What the five said	Quotes (attributed, verbatim)	Feeds finding #
Clarity — unsure what the platform wanted, or what would happen next	TBD	TBD	
Error recovery — noticing a mistake and getting back on track	TBD	TBD	
Speed — anything slower or more effortful than it should be	TBD	TBD	
Trust — confidence that the report went through and someone would see it	TBD	TBD	

9. Findings, ranked by severity

Severity scale (Nielsen 0–4, as required by §6 Task 2 Phase 3):

0	Not a usability problem
1	Cosmetic — fix if time permits
2	Minor
3	Major — high priority
4	Catastrophe — fix before release

Rules applied when turning observations into the rows below, per `docs/usability_testing/00_Run_Plan.md` §4.3:

- Group by **cause, not symptom** — three participants stumbling in three places for one underlying reason is **one** finding.
- **Systemic** (a finding): hit in ≥ **2 of 5** sessions, *or* once with a structural cause that can be named. **Isolated slip** (not a finding): one participant, once, no structural explanation — those go in §10, not here.
- Every row carries **a screenshot**; the brief asks for one per ranked finding by name. Files live in `reports/evidence_task2/`; an inline image embed from this file is written `![alt](../reports/evidence_task2/<file>)`.

- Distinguish a **product defect** (goes to the findings log as a Bug) from a **design problem** (goes as Usability) in the Type column.

#	Severity (0–4)	Type (Bug / Usability)	Finding	Participants affected (of 5)	Evidence: quote + session timestamp	Screenshot (`reports/evidence_task2/`)	Root cause	Recommendation	Log ID
(none yet — no sessions run)									

10. Observations that are not findings

Single-participant slips with no structural cause, and anything interesting that does not meet the bar in §9. Recorded so the evidence is complete, explicitly **not** counted as findings and not ranked — padding the finding count with these is how a small study starts overclaiming.

Observation	Participant	Why it is not promoted to a finding
(none yet)		

11. Prioritised recommendations

Concrete and actionable — name the screen, the control, and the change. Ordered by severity first, then by cost to fix, so the top of the list is what to do on Monday morning. Each row must trace back to a finding number in §9; a recommendation with no finding behind it is an opinion.

Priority	From finding #	Screen / control	Concrete change	Severity addressed	Est. effort (S/M/L)
1					
2					
3					

12. Limitations

- **n = 5** supports discovery, not measurement. Five was set by the brief, not chosen from a cost–benefit curve; no percentage, confidence interval or significance claim is made anywhere in this report.
- **Scope is narrower than Task 1B.** Participants exercise D1 and D2 (and D5 only if they went there themselves). **D3/D4 are driven by the moderator**, because a usability participant cannot be handed an admin account — so the admin side has checklist coverage (Task 1B) but no user-testing coverage.
- **Single environment.** One browser, one device class, one network, per §1 — cross-platform behaviour is Task 3's evidence (`docs/04_Task3_Cross_Platform_Matrix.md`), not this report's.
- **Recruiting bias.** Participants came from the moderator's own network (see `docs/usability_testing/Recruiting_Kit.md` §2), which skews younger and more digitally literate than the full EMS population; findability results are therefore, if anything, optimistic.
- **The moderator is also the report's author**, so the observation and the analysis are not independent. Mitigated by fixing the success criteria and the probe wording before the first session, not after seeing the data.
- **Known defects were present during the sessions** (`docs/usability_testing/Moderator_Runsheet.md` §4). Where one caused a task failure, the failure is the product's and is recorded as such — but it also means task times are not a clean measure of the intended design.
- TBD — add anything specific to the sessions as actually run: outages, a rescheduled participant, a failed recording, a task not reached.

13. Handoff — findings channel (§7) and evidence

Every genuine defect and every usability improvement from these sessions is logged in `docs/05_Bug_Usability_Findings_Log.md` from **D-023 onwards** (D-001…D-022 are taken — D-020…D-022 came from Task 3; D-013, D-014 and D-018 are retired and must not be reused), typed `Bug` or `Usability`

with the 0–4 severity, and **each one also submitted to the Google Form** named in §7 of the brief. The log and the form must agree — the TA may cross-check the counts.

Finding # (§9)	Findings-log ID	Submitted to the form (timestamp)

Evidence index. Session recordings and screenshots are in `reports/evidence_task2/`, named `P<n>_<task>_<what-it-shows>.<ext>` per `docs/usability_testing/Moderator_Runsheet.md` §7. Raw session notes are in `docs/usability_testing/session_notes/`; raw SUS answers in `docs/usability_testing/SUS_Responses.csv`.

AI assistance on this report (study design, scoring, clustering, drafting) is declared in `docs/06_AI_Audit_Report.md`, which states explicitly that **the sessions, the participants and the session data were not AI-produced**.
