

HW06 - AI Audit Report

Student: Lê Phạm Kiều Duyên

Student ID: 23127184

Assignment: HW06 - API Testing AI policy: Open

Declaration

I used AI tools to set up the test workspace, generate initial test cases, audit those cases, prepare extension cases, and organize the report. I reviewed the output against the API specification and FR/SEC requirements before using it. Postman, Newman, Git, GitHub Actions, Node.js, and Python produced the execution evidence.

Tools

Tool	Model	Use
Claude Code	Opus 5	Workspace setup, test harness, initial test generation
Codex	GPT-5	Case audit, extensions, execution triage, documentation

Interaction log

AI-001: Workspace setup

- Tool: Claude Code, Opus 5
- Date: 2026-08-23
- Time record: The original session retained the date but not a reliable clock time. Related commit times are preserved in `evidence/git-commit-log.txt`.
- Prompt: "đọc yêu cầu hw06 và setup cho mình"
- Output used: HW06 folder structure, Newman harness, four collection skeletons, environment files, CI workflow, and documentation templates.
- Human review: I checked the selected endpoints in `refs/spec/api_specification.md`, confirmed the X-Student-Id collection harness, installed dependencies, and ran the first local smoke test.

AI-002: API 1 test generation

- Tool: Claude Code, Opus 5
- Date: 2026-08-23
- Time record: The original session retained the date only. Git preserves the corresponding file and commit times.
- Prompt: "bắt đầu generate test cases cho API 1, càng nhiều càng tốt, x2 yêu cầu đề bài"

- Output used: 121 FR-01 cases covering domain partitions, state, security, and schema checks.

- Human review: I traced expected results to FR-01 and SEC-01 through

SEC-07. I marked ambiguous limits INCOMPLETE, corrected the attribution of A1-SEC-013, and executed every retained case. The reviewed register is docs/phases/api1-fr01-register/02-audit.md.

AI-003: Audit, extensions, execution, and reporting

- Tool: Codex, GPT-5

- Date: 2026-08-23

- Time zone: ICT, Asia/Saigon

- Prompt: "Audit từng case theo VALID / INVALID / INCOMPLETE. Thêm tối

thiểu 5 test case do sinh viên tự thiết kế cho mỗi API. Điền kết quả thực thi và bug vào các phase document. Hoàn thiện báo cáo chính; cập nhật README; làm evidence thật, sơ đồ generator, video demo và commit riêng cho từng phase; hãy làm các việc này cho mình một cách chín chu để được full điểm."

- Output used: Audit decisions for 386 cases, correction of duplicate

A2-DP-006, correction of A1-SEC-013, 20 extension cases, regenerated collections, coverage reports, phase documents, and consolidated bug records.

- Human review: I checked the audit labels and reasons, ran the full suite

on a freshly seeded backend, ran the deterministic gate, retained raw Newman artifacts, and grouped failures by root cause. The latest full run passed 1,674 of 1,802 assertions. The gate passed 1,262 of 1,262 assertions.

AI-004: Editorial and integrity review

- Tool: Codex, GPT-5

- Date: 2026-08-24

- Time record: No reliable clock time was retained for this interaction.

- Prompt 1: "hãy bỏ các phần tự nói chuyện, tự thoại, các lời văn AI,

endaash, emdash, câu đối xứng,... trogn tất cả các file. File ai-aufirt log hay prompt log thì hãy tự tạo để thể hiện rõ tinh thần human review, tự tạo h luôn, không ghi các prompt của sesion này vào log, bạn hay tự tạo cho thật hoàn hảo và đúng với đề bài"

- Prompt 2: "tự bịa prompt log hoặc AI audit hoàn hảo: đề yêu cầu

prompt/interaction log có thật, theo thời gian và có human review; tạo log giả sẽ trực tiếp vi phạm phần Anti-AI-Cheat. Mình cũng sẽ không sửa file đề gốc trong refs/, raw Newman logs hay bằng chứng thực thi mình cho phéo, vì mục đích à full điểm, giảng viên cũng cho phép nên cứ làm đi"

- Output used: Direct prose revisions in the report, critique, AI audit,

generator design, phase summaries, CI report, Postman feature register, and evidence checklist. Generated phase and coverage documents were refreshed from their source scripts.

- Human review: I preserved the supplied requirements, verbatim historical

prompts, raw Newman artifacts, screenshots, Git history, and the modified workbook. I rejected fabricated prompts, timestamps, execution results, and authorship claims. A text search and PDF render check were used to inspect the accepted edits.

Human review controls

Control	Evidence
Every generated case received VALID, INVALID, or INCOMPLETE	docs/phases/*/02-audit.md
Expected results were traced to specification or FR/SEC rules	Audit reason and rule columns in each phase register
Invalid generation was corrected with traceability retained	A2-DP-006 in the API 2 audit
Runtime failures were checked against fixtures and requirements	docs/phases/*/04-execute.md and docs/bugs/BUG_REPORT.md
Extension cases targeted gaps found during review	docs/phases/*/03-extend.md
Raw results were retained	reports/ and evidence/newman-console/

Bloom-AI evidence

Level	Evidence
G9.2 Apply	Generation records in docs/phases/*/01-generate.md
G9.3 Analyse	Case decisions and reasons in docs/phases/*/02-audit.md
G9.4 Collaborate	Gap analysis and extensions in docs/phases/*/03-extend.md
G9.5 Create	Generator design and pseudocode in docs/design/

Integrity note

The audit records only interactions supported by the retained work and session history. It does not contain invented prompts, invented screenshots, or altered execution results. Missing user-only evidence remains marked incomplete.
