

AI Audit Report

Declaration

I use AI tools for the following tasks: reviewing the HW05 requirements, designing and validating reusable performance-testing skills, preparing the test environment, generating deterministic test data, measuring the baseline, and drafting reviewable Markdown artifacts. All execution evidence and measured values are produced by the real local SUT and tools and are subject to human review.

Interaction 01 — Skill review

Field	Value
Tool	OpenAI Codex
Date	2026-08-16 (Asia/Saigon)
Prompt	đọc yêu cầu HW05 và xem skills mình xây đã chuẩn chưa để bắt đầu làm các bước tiếp theo
Output	Reviewed the official requirements, course slide, five skills, scripts and JMeter assets; identified Stress-shape, portability, analyzer, PID-selection and evidence-coverage gaps.
Human review	Accepted the valid findings and requested fixes before execution.

Interaction 02 — Skill hardening

Field	Value
Tool	OpenAI Codex
Date	2026-08-16 (Asia/Saigon)
Prompt	oce sửa để 10/10
Output	Implemented a four-stage Stress staircase, portable data.dir, CSV preflight validation, explicit backend PID selection, safer resource-job cleanup, corrected JTL tail-bucket logic, cautious memory interpretation and an HW05 evidence contract. All five skills passed validation and a JMeter smoke test.
Human review	The student requested a conventional Git commit without co-author attribution.

Interaction 03 — Skill commit

Field	Value
Tool	OpenAI Codex
Date	2026-08-16 (Asia/Saigon)
Prompt	commit cho mình theo conventional, k có co author
Output	Created commit e385ad7 feat(hw05): harden performance testing skills; verified no Co-authored-by trailer and excluded unrelated untracked files.
Human review	Commit scope and message were accepted.

Interaction 04 — Begin HW05 execution

Field	Value
Tool	OpenAI Codex
Date and time	2026-08-17, Phase 1 session (Asia/Saigon)
Prompts	mssv cuar mình là 23127184, hãy làm thật chuẩn cho mình để được 100/100 nha and mình xác nhận k trùng
Output	Confirmed Student ID 23127184 and the unique Login → Search → Detail → Cart → Checkout workflow. Inventoried real hardware/tools, started EShop with LOADTEST=1, recorded backend PID 16028, seeded and validated 240 API-created test accounts/CSV rows, measured seven single-user samples per endpoint, verified resource monitoring, and created Phase 1 environment/criteria artifacts.
Human review required	Verify all thresholds, capture dxdiag/Task Manager screenshots, and retain only genuine run/video evidence.

Audit limitation

This Markdown log records the prompts and material outputs/actions. Export or screenshot the original Codex conversation too if the instructor requires every assistant message verbatim rather than an attributable audit summary.

Interaction 05 — Plan and design

Field	Value
Tool	OpenAI Codex
Date and time	2026-08-17, Phase 2 session (Asia/Saigon)
Prompt context	Continue the confirmed HW05 workflow toward a 100/100-quality submission.
Output	Applied Little's Law to the measured 30.4 ms workflow and a disclosed 2.5 s compressed think time. Replaced inherited defaults with Load 34 VU, four-stage Stress to 132 VU, Spike 168 burst VU plus a 17 VU baseline, and Soak 27 VU; documented data recycling, metrics, listeners, reset/evidence gates and a human critique of the AI plan.
Human review required	Confirm the calculations and do not execute official runs until free RAM and same-frame video evidence are ready.

Interaction 06 — Plan generation and pilot review

Field	Value
Tool	OpenAI Codex
Date and time	2026-08-17, implementation/pilot session (Asia/Saigon)
Prompt context	Implement and verify the approved HW05 performance plan without fabricating official evidence.
Output	Generated the four official JMX plans dated 20260817 and corrected stale sizing comments. Reset/reseeded the backend, ran a 2 VU/30 s diagnostic pilot with JTL, HTML and resource sampling, then recomputed the raw JTL. Human review found that 23 successful controller rows represented only 22 endpoint-complete journeys because the scheduler stopped an iteration at the tail. The analyzer and skill documentation were corrected to require all five journey labels and expose tail/ambiguous rows.
Human review required	Treat the pilot only as implementation validation; record free RAM and same-frame video before official runs.

Interaction 07 — Uniqueness confirmation and official-run gate

Field	Value
Tool	OpenAI Codex
Date and time	2026-08-17, pre-execution review (Asia/Saigon)
Prompt	mình xác nhận k trùng
Output	Recorded the student's confirmation that Login → Search → Detail → Cart → Checkout is not duplicated. Rechecked the host and found only 0.36 GB free RAM, so official execution was withheld. Added a scenario-by-scenario checklist for reset, same-frame recording, genuine artifacts, invalid-run handling, analysis and submission gates.
Human review required	Close unnecessary applications, verify at least 2 GB free RAM, capture the hardware screenshot and start screen recording before authorising the first official Load run.

Interaction 08 — Official execution, raw analysis and report completion

Field	Value
Tool	OpenAI Codex
Date and time	2026-08-17 to 2026-08-18 (Asia/Saigon)
Prompts	bạn tự làm mấy việc đó lun đi, hw của mình đã tới đâu rồi, and commit trạng thái hiện tại và tiếp tục làm những việc chưa làm
Output	Closed restartable background applications, captured genuine dxdiag and same-frame JMeter/Task Manager screenshots, reset/reseeded the SUT before each scenario, and executed Load, Stress, Spike and Soak. Preserved four complete JTL/HTML/resource/log/run-record sets and committed them as 98462cf. Recomputed per-label and complete-journey statistics, corrected controller-tail overcounting, found no Stress knee through 132 VU, measured Spike recovery within 30 seconds and demonstrated a 54.5 req/s Soak threshold with a 172.0 MB memory ceiling. Drafted the main report, 272-word critique, recommendation review and continuous-performance proposal.
Human review required	Review the critique in the student's own voice, record/upload the required Vietnamese-narrated video, add both video links to README, and run the prepared 198-VU retest only when free RAM is at least 2 GB.

Interaction 09 — Submission audit and finalisation

Field	Value
Tool	OpenAI Codex
Date and time	2026-08-18, finalisation session (Asia/Saigon)
Prompt	hi, hww05 cuar mình làm tới đâu rồi và còn thiếu gì làm nốt cho mình để mìn sắp tới hạn nộp bài
Output	Audited the repository against the official rubric and the HW05 evidence contract; confirmed all four JMX plans, four raw JTL/HTML/resource result sets and genuine screenshots; rebuilt and visually checked the eight-page main PDF and three-page AI Audit PDF; verified that the public repository exists but the local hw5 branch was not yet on the remote; prepared the final submission checklist, Vietnamese video runbook and a fail-closed packaging script. No video URL or student narration was fabricated.
Human review required	Record/upload the genuine unlisted video, confirm the critique in the student's own voice, provide the URL and open the generated ZIP once before Moodle upload.
